Specifications

The performance specifications describe the complete instrumental uncertainty of the Product. The specifications include stability, temperature, and humidity; within specified limits, linearity, line and load regulation, and the reference standard measurement uncertainty. The product specifications are provided at a level of confidence of 99 %, k=2.58, normally distributed. In some cases, additional specifications with a level of confidence of 95 %, k=2, normally distributed are also listed. Fluke Calibration guarantees product performance to the 99 % level of confidence.

Specifications are valid after a Product warm-up period of 30 minutes, or twice the time that the Product has been turned off.

Frequency Specifications

With REF CLK set to external, the frequency uncertainty is the uncertainty of the external 10 MHz clock. The amplitude of the external clock should be between 1 V p-p and 5 V p-p.

Frequency Range	Resolution	1-Year Absolute Uncertainty	Jitter

1.200 MHz to 2.000 MHz	1 kHz		

Resistance Specifications

Continuously variable from 0 Ω to 1200 M Ω .

Applies for four-wire compensation only. For COMP OFF or two-wire COMP, add an additional amount to the floor specification as calculated by: (5 μ V divided by the stimulus current in amps). For example, in two-wire mode, at 1 k Ω the floor specification within 24 hours of an ohms zero cal for a measurement current of 1 mA is: 0.004 Ω + (5 μ V / 1 mA) = (0.004 + 0.005) Ω = 0.009 Ω).

In RF fields between 2 V/m and 3 V/m from 80 MHz to 140 MHz, increase specifications by 150 %. For conducted RF voltages between 2 V and 3 V from 25 MHz to 50 MHz, increase specifications by 160 %.

Resistance Operating Characteristics

Max burden voltage of 13 V.

For currents lower than specified, the floor adder increases by $\text{Floor (new)} = 2.5 \times \text{Floor (old)} \times I_{\text{min}}/I_{\text{actual}}$. For example, a 50 μA stimulus measuring 100 Ω has a floor specification of: $2.5 \times 0.0015 \Omega \times 1 \text{ mA}/50 \mu\text{A} = 0.075 \Omega$ assuming an ohms zero calibration within 24 hours.

For currents higher than specified (up to max current) the specification increases to $\text{Spec(new)} = \text{Specification} \times (I_{\text{actual}} / I_{\text{specmax}})^{0.5} + \text{Floor}$. For example, measuring 100 Ω with a 30 mA current with 1 year 99 % confidence has a specification of $0.0065 \Omega \times (30 \text{ mA} / 13 \text{ mA})^{0.5} + \text{Floor} = 0.0099 \Omega + \text{Floor}$.

Capacitance Specifications

The output is continuously variable from 0 pF to 120 mF, specified range 200 pF to 120 mF.

Specifications apply to both dc charge/discharge capacitance meters and ac RCL meters. The maximum allowable peak voltage is 10 V. The maximum allowable peak current is 130 mA, with an rms limitation of 30 mA at 1.2 μ F and below and 70 mA above 1.2 μ F.

The maximum lead resistance for no additional error in ZCOMP two-wire mode is 10 Ω .

Specifications apply for COMP OFF. For four-wire or two-wire COMP, add 15 pF for all ranges, plus 0.03 % of output for the 1.2 μ F range, 0.05 % of output for the 120 μ F range, 0.04 % of output for the 1.2 mF range, 0.07 % of output for the 12 mF range, and 0.21 % of output for the 120 mF range.

Risetime, Settling Time, and Overshoot are @ 400 Hz.

Frequency (Hz)	Risetime	Settling Time (to 1% of Final Value)	Overshoot
3 to 10 k	<25 μ s	<40 μ s	<10 % for <1 V compliance

ACV DC Offset Specifications

For frequencies 500 kHz to 2 MHz, the offset uncertainty is 5 % of output, ± 1 % of the range.
